

Jim Roberts, DVM, CVCP

Jim Roberts, DVM, CVCP, is a VOM certified veterinarian with more than 20 years' experience in the Kentuckiana area, and has provided VOM Technology to patients for over 14 years.

HAPPY, HEALTHY PETS IS OUR GOAL

Dr. Roberts uses a cutting edge class 3b frequency specific laser as part of his extensive therapy plan.

The combination of VOM Technology, Myofascial Release, and condition-specific Laser Therapy, will provide your pet with a comprehensive, effective, and affordable combination of therapies, increasing chances of clinical success.

Happy, healthy, and good quality of life are the goals.

LASER THERAPY

Cutting edge therapy promoting positive cellular activity for improved clinical outcomes

INNOVATIVE THERAPY

Laser Therapy is an innovative treatment that provides many tissue-healing benefits for a wide variety of medical conditions. There is an abundance of applications for laser therapy in our patients.

Laser is the acronym for “light amplification of stimulated emission of radiation”. A laser is a device that emits focused, penetrating light beams with 3 qualities:

- Light that is a single wavelength (monochromatic)
- Photons travelling in the same phase and direction (coherent)
- Photons that travel in a single straight beam (collimated)

These qualities allow the therapeutic laser to be tissue penetrating, in a focused area, which leads to activation of a whole range of positive cellular activity (photobiomodulation).

These stimulated cellular activities, lead to the positive effects of laser therapy such as:

- Relief of chronic and acute pain by modulation of nerves’ function and speed
- Increases speed of tissue repair by increasing blood circulation
- Stimulates the Immune System
- Reduces Inflammation
- Enhances collagen and muscle development, which in turn enhances healing
- Stimulates development of new blood vessels
- Reduces swelling from injury
- Stimulates nerve healing, and reduces nerve damage

CONDITIONS

Conditions benefiting from laser therapy include:

- Pain and inflammation
- Spinal related injuries (including disc disease)
- Joint disorders
- Lameness – acute and non-acute
- Progressive lameness (arthritis)
- GI motility disease
- Progressive myelopathies (“down in the rear” dogs)
- Organ disorders (e.g. liver disorders)
- Wound healing
- Cats and Exotics with limited medication options
